

1 Learning the emitter (During the programming only that 1 piece of motor can be under voltage.)

2 Change direction

If the motor has wrong direction after the programme, cut down the power for 3 seconds and learn the emitter again with the opposite direction button.

3 Copy the emitter (Don't need power cut off, this is the only way to learn more emitter to a motor.)

4 Erase the emitter (With this erase all of the emitters will be erased from the motor.)
